Keywords:

Coleoptera; new species;
Dermestidae; description;
Megatominae; *Anthrenus*;
taxonomy; Senegal.

Abstract – The species *Anthrenus (Anthrenus) coacheorum* sp. nov. from Senegal is described, illustrated and compared with the similar species *A. (Anthrenus) senegalensis* Pic, 1927.

Háva J., 2022. – *Anthrenus (Anthrenus) coacheorum* sp. nov. from Senegal (Coleoptera: Dermestidae: Megatominae). Faunitaxys, 10(13) : 1 – 3.

ZooBank: <http://zoobank.org/EE4AEC91-39D0-45A0-9E05-79B36FAAED6F>

Introduction

The family Dermestidae currently includes approximately 1750 species and subspecies worldwide and the genus *Anthrenus* Geoffroy, 1762 currently includes 278 species worldwide (Háva, 2022) including the new species described herein. Six species have been recorded from Senegal (Háva, 2021; Háva & Coache, 2020). In the present paper, a new species of the nominotypical subgenus *Anthrenus* is described from Senegal.

Material and methods

– The size of the beetles or of their body parts can be useful in species recognition and thus, the following measurements were made:

TL total length: linear distance from anterior margin of pronotum to apex of elytra.

EW elytral width: maximum linear transverse distance.

Deposition of type material:

AC: private collection of Alain Coache, La Brillanne, France.

JHAC: Private Entomological Laboratory & Collection, Jiří Háva, Únětice u Prahy, Prague-west, Czech Republic.

MHNL: Musée d'Histoire Naturelle de Lyon, Lyon, France.

– The nomenclature and zoogeography follow Háva (2015) and Motyka et al. (2022).

– All the colour photographs were taken by a Nikon Coolpix 990 digital camera through an MBS-10 binocular stereo microscope and 3D Microscope with Full HD Camera.

– Specimens of the presently described species are provided with red, printed label with texts as follows:

« HOLOTYPE [or PARATYPE] *Anthrenus* (s. str.) *coacheorum* sp. nov. J. Háva det. 2022 ».

Results

Anthrenus (Anthrenus) coacheorum sp. nov.

(Fig. 1-4)

ZooBank: <http://zoobank.org/3CCA0DFA-D725-4CFA-862B-760D90C6AE8B>

Holotype, ♂: “Sénégal, Forêt de Ngazobil, 27.X.2010, fauchage, Alain Coache leg.” (MHNL).

Paratypes

- 2 ♂, 42 spec. unsexed, the same data as holotype (36 AC, 8 JHAC);
- 4 spec. unsexed: “Sénégal, Petite Côte, Niaming, fauchage savane, 25.X.2010, Alain Coache leg.” (3 AC, 1 JHAC);
- 16 spec. unsexed: “Sénégal, Petite Côte, Mbour Ird, fauchage, 01.XI.2010, Alain Coache leg.” (12 AC, 4 JHAC).

Description of the holotype

Measurements (mm). – TL 2.4, EW 1.8.

Body. – Convex, broadly oval, covered with oval-subtriangular scales. Dorsal and ventral surfaces of integument dark-brown, almost black, sparsely punctured, covered by scales (Fig. 1).

Head. – Visible from above. – **Eyes** large, convex, with internal, medial deep and broad emargination, with intermixed whitish and light brownish-yellow scales. – **Median ocellus** present. – **Clypeus** emarginate. – **Labrum** light brown, with short tan setae on the entire dorsal surface. – **Antenna** with 11 antennomeres, antennal club dark brown, composed of 3 antennomeres (Fig. 3). – **Antennal fossa** conforming to shape of antennal club.

Pronotum. – Covered by intermixed whitish and light brownish-yellow scales, and brown scales forming patches discally and near scutellum. Lateral margin of pronotum dilated above antennal fossa and visible from above.

Scutellum. – Small, without scales.

Elytra. – Covered by whitish, light brownish-yellow and brown scales. The scales are abraded on most of the elytra, white and brown scales forming patches. – **Humeri** with large bump. Individual scales more or less triangular with apex of scales truncate and lapped arcuate.

Ventral surface. – Covered by whitish scales. Light brownish-yellow scales covering posterior margin of ventrites II-V, middle section of ventrite V with only whitish scales; ventrites I-V sometimes entirely with whitish scales; first abdominal ventrite with post-coxal lines, sulcus without scales. – **Abdominal ventrites** as in Fig. 2.

Pygidium. – Dark brown with sub-basal, transverse, carina-like line with adjacent setae; light brown setae limited to apical area.

Legs. – Dark-brown and covered with white scales and black setae on dorsal surface. – **Tibiae** without distinct teeth. – **Tarsus** with two slightly curved claws.

Male genitalia. – As in Fig. 4.

Female. – Externally similar to male.

Etymology. – Patronymic, dedicated to my friends Alain and Djee Coache (France).

Variability. – Body measurements (mm): TL 2.2-2.4, EW 1.7-1.8. The brown elytral scales forming patches, which are extremely variable.

Differential diagnosis. – The new species is externally similar to *Anthrenus (Anthrenus) senegalensis* Pic, 1927, but differs from it by the broad form of the body, structure of antennae and male genitalia (Fig. 1-8).

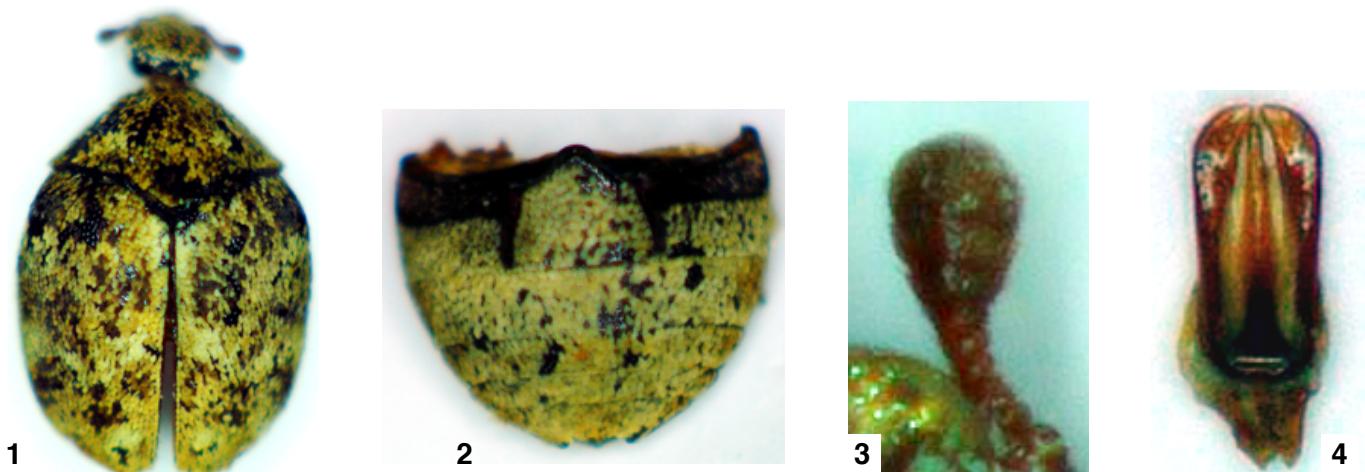

Fig. 1-4. *Anthrenus (Anthrenus) coacheorum* sp. nov., holotype. 1. Habitus, dorsal. 2. Abdomen. 3. Antenna of male. 4. Male genitalia.

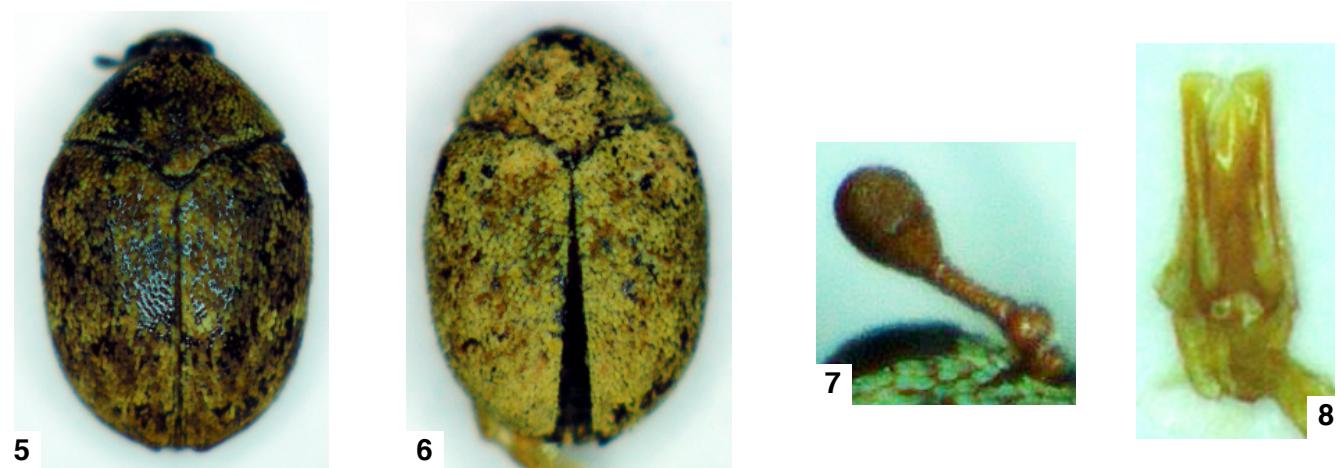

Fig. 5-8. *Anthrenus (Anthrenus) senegalensis* Pic, 1927. 5. Habitus, dorsal, dark form. 6. Habitus, dorsal, light form. 7. Antenna of male. 8. Male genitalia.

Acknowledgements

I am indebted very much to Alain Coache (France) for providing me the interesting material, to Larry G. Bezark (California, U.S.A.) for a revision of the English manuscript. The paper was supported by the Ministry of Agriculture of the Czech Republic, institutional support MZE-RO0118.

Résumé

Háva J., 2022. – *Anthrenus (Anthrenus) coacheorum* n. sp. du Sénégal (Coleoptera: Dermestidae: Megatominae). *Faunitaxys*, 10(13) : 1 – 3.
Anthrenus (Anthrenus) coacheorum sp. nov. est décrite du Sénégal. Elle est illustrée et comparée à *A. (Anthrenus) senegalensis* Pic, 1927, l'espèce la plus proche.

Mots-clés. – Coleoptera, Dermestidae, Megatominae, taxinomie, nouvelle espèce, description, *Anthrenus*, Sénégal.
