Attageninae; *Attagenus*;
Megatominae; *Phradonoma*;
taxonomy; Iran.

Abstract. – A new species, *Phradonoma isatis* sp. nov., from Iran: Yazd Province is described, illustrated and compared with a similar Iranian species from the « *Phradonoma nobile* species group ».

Háva J., 2022. – A new Dermestidae species (Coleoptera: Bostrichoidea) from central Iran. *Faunitaxys*, 10(15) : 1 – 3.

ZooBank: <http://zoobank.org/E78C8E30-EC9B-45E9-BB4B-E644194E73A4>

Introduction

The family Dermestidae (Coleoptera) currently includes approximately 1750 species and subspecies worldwide (Háva 2022), Iranian Dermestidae summarized in a catalogue by Ghahari & Háva (2017). In the present article, a new species belonging to the genus *Phradonoma* Jacquelin du Val, 1859 is described and five species are recorded from the Yazd Province. The Dermestidae from locality mentioned is poorly known; new records from the locality concerning other Coleoptera families were published by Khormizi et al. (2016a,b).

Material and methods

– The size of the beetles or of their body parts can be useful in species recognition and thus, the following measurements were made:

TL total length: linear distance from anterior margin of pronotum to apex of elytra.

EW elytral width: maximum linear transverse distance.

– The following collection acronyms are used:

JHAC: Private Entomological Laboratory & Collection, Jiří Háva, Uněťice u Prahy, Prague-West, Czech Republic;

JVPC: Jaroslav Větrovec, private collection, Hradec Králové, Czech Republic.

– All the colour photographs were taken by a Nikon Coolpix 990 digital camera through an MBS-10 binocular stereo microscope and 3D Microscope with Full HD Camera.

– Specimens of the presently described species are provided with red, printed labels with the text as follows:

« HOLOTYPE [or PARATYPE, respectively] *Phradonoma isatis* sp. nov. Jiří Háva det. 2022 ».

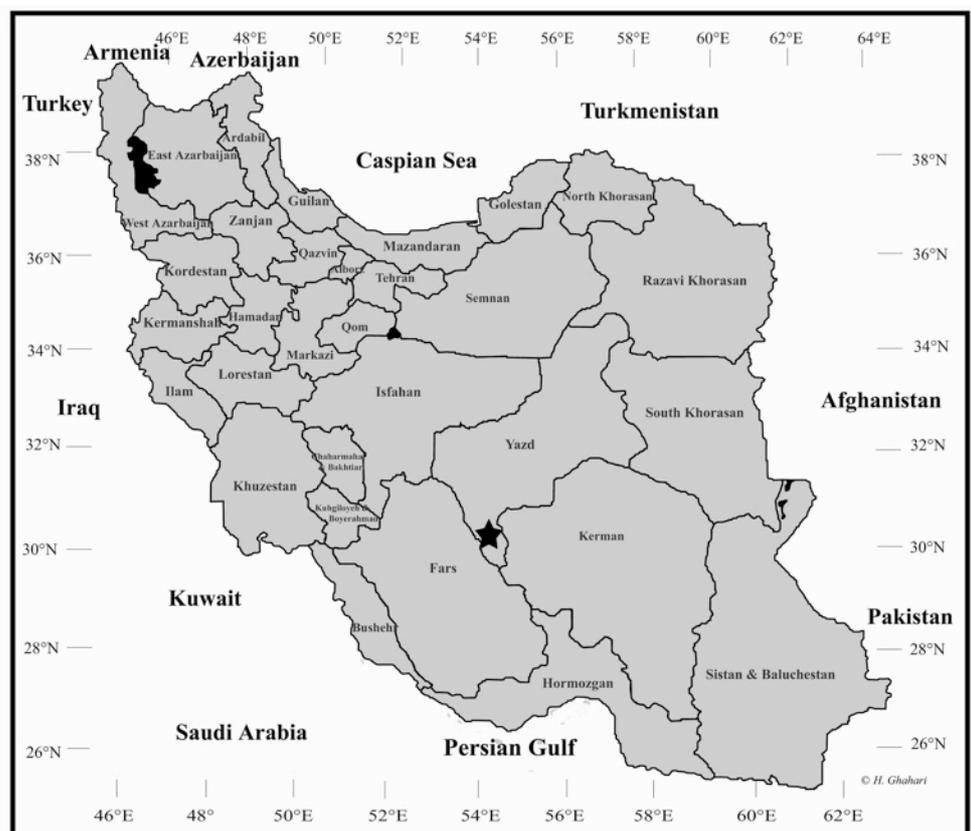

Results

Subfamily Attageninae

Attagenus (Attagenus) brunneus Faldermann, 1835

Material examined: « Iran central, [Yazd Prov.], Khatam [County], Bagheshadi Jungle, 29°48'27" N 54°09'18" E, 28.6.2013, Mehdi Zare Khormizi leg. », 1 ♀, J. Háva det. (JVPC).

Distribution. – A holarctic species, from Iran cited by Ghahari & Háva (2017), first published data from Yazd Province.

Map 1. Map of Iran. Asterisk indicates type locality in Iran, Yazd Province.

Attagenus (Attagenus) unicolor unicolor (Brahm, 1790)

Material examined: « Iran central, [Yazd Prov.], Khatam [County], Bagheshadi Jungle, 29°48'27''N 54°09'18''E, 28.6.2013, Mehdi Zare Khormizi leg. », 1 ♀, J. Háva det. (JVPC).

Distribution. – A cosmopolitan species, from Iran cited by Ghahari & Háva (2017), first published data from the Yazd Province.

Subfamily Megatominae

Genus *Phradonoma* Jacquelin du Val, 1859

The genus *Phradonoma* Jacquelin du Val, 1859 currently includes 48 species worldwide (Háva 2022), 10 species are known from Iran (Ghahari & Háva 2017)

Phradonoma muehle Herrmann & Háva, 2008

Material examined: « Iran central, [Yazd Prov.], Khatam [County], Bagheshadi Jungle, 29°48'27''N 54°09'18''E, 28.6.2013, Mehdi Zare Khormizi leg. », 1 ♂, J. Háva det. (JVPC).

Distribution. – The species was described from Iran: Yazd Province.

Phradonoma nobile (Reitter, 1881)

Material examined: « Iran central, [Yazd Prov.], Khatam [County], Bagheshadi Jungle, 29°48'27''N 54°09'18''E, 28.6.2013, Mehdi Zare Khormizi leg. », 1 ♀, J. Háva det. (JVPC).

Distribution. – A cosmopolitan species, from Iran cited by Ghahari & Háva (2017).

Phradonoma pseudoamoenum Herrmann & Háva, 2008

Material examined: « Iran central, [Yazd Prov.], Khatam [County], Bagheshadi Jungle, 29°48'27''N 54°09'18''E, 28.6.2013, Mehdi Zare Khormizi leg. », 1 ♂, J. Háva det. (JVPC).

Distribution. – The species was described from Iran: Markazi Province, new for Yazd Province.

Phradonoma isatis sp. nov.

(Fig. 3-5)

ZooBank: <http://zoobank.org/08B70627-8AF3-47A9-BB8A-157E51DAD73A>

Holotype, ♂: « Iran central, [Yazd Prov.], Khatam [County], Bagheshadi Jungle, 29°48'27''N 54°09'18''E, 28.6.2013, Mehdi Zare Khormizi leg. » (JHAC).

Description of holotype.

Male. Body black, oval (Fig. 3).

Measurements (mm). – TL 2.0 EW 1.3.

Head. – Coarsely punctate, with long more or less decumbent light brown setae, maxillary palpi darkish brown. – **Eyes** large with microsetae. – **Antennae** with 11 antennomeres, with 4-antennomered club. The antennomeres I-X is brown, antennomere XI darkish brown (Fig. 4). – Forehead with ocellus.

Pronotum. – Entirely black, shiny, sparsely and not very coarsely punctate, with strong dark and slightly erect brown setae. Lateral margins not visible from above.

Scutellum. – Small, black, triangular, without setation or punctures.

Elytra. – Black with very narrow, brown apical part, sparsely covered by slightly erect brown, yellow and white setation (most of the setation is abraded).

Underside. – Coarsely and (especially the visible ventrites) more densely punctate than elytra and pronotum, covered with straight and procumbent brown setae.

Legs. – **Tibiae** and **tarsi** brown. – **Femora** anteriorly darkened and sparsely covered with fine brown hairs. – **Anterior tibia** with spines along shaft.

Male genitalia. – As in Fig. 5.

Female. – Unknown.

Differential diagnosis. – The new species belongs to the *P. nobile* species group. From similar Iranian species, it differs by the characters presented in the key below.

Etymology. – The specific epithet *isatis* is a noun in apposition, and refers to the historic name of Yazd, the type locality of the species.

Fig. 1-2. Locality of Bagheshadi Jungle in Yazd Province, Khatam County (photo by Mehdi Zare Khormizi).

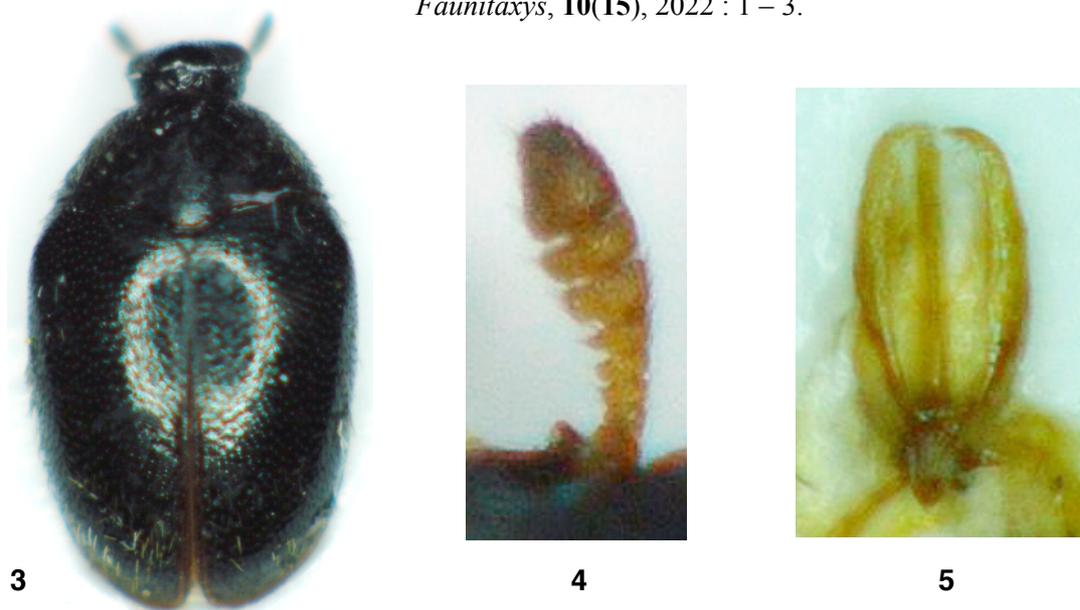

Fig. 3-5. *Phradonoma isatis* sp. nov.: 3. Habitus, dorsal. 4. Antenna. 5. Male genitalia.

Key to Iranian species of *Phradonoma nobile* species group

1.	Elytra with reddish or orange-reddish transverse bands and spots	4
—	Elytra without reddish transverse bands and spots	2
2.	Elytra brown with transverse narrow fasciae of white setation	<i>P. pseudoamoenum</i> Herrmann & Háva
—	Elytra black with apical part somewhat brightened to dark brown	3
3.	Antennal club black, 3-antennomered; apical part of elytra somewhat brightened to dark brown; body length 2.2 - 3.2 mm	<i>P. muehlei</i> Herrmann & Háva
—	Antennal club dark brown, 4-antennomered; elytra with very narrow, brown apical part; body length 2.0 mm	<i>P. isatis</i> sp. nov.
4.	Terminal antennal segment triangular; elytra brownish-black except for three (sometimes only two) reddish transverse bands	<i>P. nobile</i> (Reitter)
—	Terminal antennal segment oval; elytra black except for three reddish transverse bands and apex	<i>P. jelineki</i> (Háva)

Acknowledgements

I am obliged very much to Jaroslav Větrovec (Czech Republic) for providing me with the interesting material and to Miloslav Rakovič (Czech Republic) for the revision of the English text of the manuscript. The paper was supported by the Ministry of Agriculture of the Czech Republic, institutional support MZE-RO0118.

Résumé

Háva J., 2022. – Un nouveau Dermestidae (Coleoptera: Bostrichoidea) d'Iran central. *Faunitaxys*, 10(15) : 1 – 3.

Une nouvelle espèce, *Phradonoma isatis* sp. nov., est décrite d'Iran, de la province d'Yazd. Elle est illustrée et comparée aux espèces iraniennes les plus proches du groupe « *Phradonoma nobile* ».

Mots-clés. – Coleoptera, Dermestidae, Attageninae, Megatominae, taxinomie, nouvelle espèce, description, *Attagenus*, *Phradonoma*, Iran.

Faunitaxys
